zehnder charleston pro

Zehnder Charleston Pro is a steel tube radiator suitable for any heating systems and has > 25 year service life under normal use and installation conditions, including under water conditions which expect corrosion.

By virtue of the special application technique for the inside coating layer, patented by Zehnder, this became the first modern heating device to combine the corrosion resistance benefits of cast iron radiators with contemporary design features of steel radiators. We are referring to the thin-layer anti-corrosion barrier that is applied to the radiator's inside surfaces. Initially, the layer is dried at 160°, with subsequent oven drying at 300°.

Zehnder Charleston Pro radiators feature the same benefits as the entire Zehnder Charleston model line, namely:

- Wide selection of models - Charleston Pro radiators are made as 2-column and 3-column models, with height from 260 to 2000 mm, with a maximum of 40 sections.
- Various connection codes.
- Completo-type assembly with an internal valve and bottom connections can be provided by special order.
- High quality enamel finish - colour selection shown in Zehnder catalogue.
- Easy and simple cleaning of the rad with the special Zehnder brush made of lamb's wool.

Model	Overall height (mm)	Overall depth (mm)	Heat capacity (W)	
			$\Delta T=50K$ (per section)	$\Delta T=60K$ (per section)
2026	260	62	21	26
3026	260	100	28	35
2030	300	62	24	30
3030	300	100	32	40

The corrosion protection effect is provided by:

- Protective barrier: multitude of overlaid zinc and aluminum particles create an excellent barrier and avert the oxygen's destructive effect upon steel.
- Galvanic action: under corrosive conditions, zinc unflinchingly protects steel.
- Etching of the inside surfaces: metal oxides on the surface of the protective layer retard the corrosion of zinc and steel.
- Cathodic protection: damaged zones are filled by oxides and carbonates; no deep corrosion of metal occurs even in case of heavy surface damage.
- The protective layer has no negative environmental impact: no contaminants are emitted.
- Radiators with protective layer can be used anywhere (including in open heating systems)
